

Min-max normalization

Friday, 26 July 2024 1:56 PM

In min-max normalization the minimum value
 from is 0 and the max-value will be 1.
 So we can say the value we get
 0 - 1.

$$v' = \frac{v - \min(A)}{\max(A) - \min(A)}$$

or

$$v' = \frac{v - \min(A)}{\max(A) - \min(A)} \times [\text{new range}]$$

where $\rightarrow$

v' = normalization form of data point.

$\min(A)$ = minimum value of data.

$\max(A)$ = maximum value of data.

New $\max(A)$ = maximum value of Range.

New $\min(A)$ = minimum value of Range.

Ex $\rightarrow$

$$v = 73600$$

$$\max(A) = 98000$$

$$\min(A) = 12000$$

$$\text{Range} = [0, 1]$$

$$v' = \frac{73600 - 12000}{98000 - 12000} \times [1 - 0] + 0$$

$$= \frac{61600}{86000} \times 1$$

$$v' = 0.71627$$
